

**Amendments to the claims:**

1. (Currently Amended) For use in a communication interface for communication between a wireless device and the communication interface, the communication interface being configured to communicate with other devices communicating with a network and configured to facilitate data communication between the wireless device and other devices connected to the network, where the network is configured under a network protocol that requires all network devices receive and send data packets related to administrative procedures within the network, including such as device naming protocols, a computer readable medium having stored thereon a plurality of sequences of instructions, said sequences of instructions including instructions that, when executed by a processor, cause said processor to perform the steps of :

receiving an initialization packet from a wireless device indicating whether the signal carrying the message is configured under a first protocol;

establishing a communication link with the wireless device;

establishing another communication link between the wireless device and the network;

and

managing the transmission to the wireless device of authorized communication signals sent from the computer system by:

receiving and analyzing signals when received;

determining whether the signals received from the network are directed to the wireless device;

if they are directed to the wireless device, screening the messages to determine whether they are configured under [[[a]]] the first protocol to prevent unauthorized signal transmissions to the wireless device; and

if the messages are directed to the wireless device and are also configured under the first protocol, then transmitting authorized signals configured under the first protocol to the wireless device according to the first communication protocol.

2. (Cancelled)

3. (Previously Amended) A method according to Claim 1, wherein the managing of the transmission includes:

Attorney Docket No. CLAR-00200

examining a data packet transferred between a wireless device and a network device;  
determining whether the data packet is authorized for transmission to the wireless device according to a first communication protocol, wherein properties of the first protocol include refraining from transmitting data packets that pertain to administrative operations of the network that are not necessary for the transmission of data packets to the wireless device; and

if the examination of a data packet indicates that the wireless device has authorized the transmission of particular communications to the wireless device, transmitting a data packet to the wireless device;

if the examination of a data packet indicates that the wireless device has not authorized the transmission of particular communications to the wireless device, not transmitting a data packet to the wireless device.

4. (Previously Amended) A method according to Claim 1, wherein the managing of the transmission includes:

examining a data packet transferred between a wireless device and a network device;  
determining whether the wireless device is configured to communicate under a first protocol, wherein the first protocol dictates whether a data packet is authorized for transmission to the wireless device, and wherein the first protocol screens administrative data packets to prevent transmissions to the wireless device that are not necessary to the transmission of data packets to wireless devices; and

if the examination of a data packet indicates that the wireless device is configured under the first protocol, transmitting a data packet to the wireless device;

if the examination of a data packet indicates that the wireless device is not configured under the first protocol, not transmitting a data packet to the wireless device.

5. (Currently Amended) For use in a communication interface for communication between a wireless device and another device via the communication interface, the communication interface being configured to communicate with other devices communicating with a network and configured to facilitate data communication between the wireless device and other devices connected to the network and to filter out certain communications from reaching the wireless device, where the network is configured under a network protocol that requires all

Attorney Docket No. CLAR-00200

network devices receive and send data packets related to administrative procedures within the network, ~~such as~~ including device naming protocols, a computer readable medium having stored thereon a plurality of sequences of instructions, said sequences of instructions including instructions that, when executed by a processor, cause said processor to perform the steps of :

- receiving a data packet transmission between a network affiliated device and a wireless device;

- analyzing the data packet when received;

- determining whether the data packet contents indicate whether the wireless device is configured to accept session data packets related to transmitting data packets other than those related to administrative operations of the network from a network device;

- if the wireless device is configured to accept session data packets from a network device, transmitting session data packets to the wireless device.

6. (Cancelled)

7. (Currently Amended) For use in a communication interface for communication between a personal data assistant (PDA) and the communication interface, the communication interface being configured to communicate with other devices communicating with the internet and configured to facilitate data communication between the PDA and other devices, where the network is configured under a network protocol that requires all network devices receive and send data packets related to administrative procedures within the Internet network, ~~such as~~ including device naming protocols, a computer readable medium having stored thereon a plurality of sequences of instructions, said sequences of instructions including instructions that, when executed by a processor, cause said processor to perform the steps of :

- receiving an initiation packet from a computer system that is intended to be broadcast to devices outside the network;

- receiving communications signals from devices outside the network that identify outside devices;

- determining which outside devices are configured as network devices by;

- (1) transmitting network related administrative data packets to the outside devices; and

Attorney Docket No. CLAR-00200

(2) analyzing the communication signals sent by such devices that are capable of communication with devices associated with the network;

sending the broadcast initiation packet to outside devices that are identified as network devices; and

filtering the broadcast initiation packet from outside devices that are identified as PDA devices to prevent the broadcast initiation packet from being transmitted to the PDA.

8. (Previously Amended) A communication interface for managing communication between a wireless device and a network device comprising:

a receiver configured to receive data packets received by the communication device, the receiver including a signal receiver configured to receive a signal used for transmitting data over a medium and converter configured to convert the data signal into a form that can be stored;

a transmitter configured to transmit data packets over a medium;

a storage device configured to store data, the storage device including a storage mechanism for storing data packets received by the receiver;

an analyzer configured to examine data packets transmitted between a wireless device and a network device, where the network is configured under a network protocol that requires all network devices receive and send data packets related to administrative device naming procedures within the network; and

a filter mechanism configured manage data transmissions between the wireless device and the network device by filtering out data packets related to administrative device naming procedures within the network.

9. (Previously Amended) A communication interface according to claim 8, wherein the analyzer includes an identifier that is configured to identify a data packet sent by a particular wireless device that is configured according to a first protocol, and wherein the filter mechanism is configured to subsequently relay data packets that are sent by a network device that are configured according to the first protocol to the particular wireless device in response to the analyzer receiving a data packet sent by the particular wireless device to prevent data packets related to network renaming procedures from being sent to the wireless device.

10. (Previously Amended) A communication interface according to claim 8, wherein the analyzer is configured to identify a data packet sent by a wireless device that is configured according to a first protocol that refrains from transmitting packets related to network naming protocols used by the network to name devices authorized to communicate with other devices connected to the network, and wherein the filter mechanism is configured to subsequently relay data packets to the wireless device that are sent by a network device and that are configured according to the first protocol by preventing unnecessary data packet transmissions to the wireless device.

11. (Previously Amended) A communication interface according to claim 8, wherein the analyzer includes an identifier that is configured to identify a data packet transmitted by a wireless device that indicates that the transmitting wireless device is configured according to a first protocol that permits transmission to devices that are not subject to naming protocols within the network by transmitting data via a network interface, and wherein the filter mechanism is configured to subsequently relay data packets that are sent by a network device that are configured according to the first protocol only to wireless devices that have transmitted such a packet having such indicia.

12. (Previously Amended) A communication interface for affecting communication between a wireless device and a network device comprising:

receiver means for receiving data packets;

converter means for converting the data signal into a form that can be stored;

transmission means for transmitting data packets over a medium;

storage means for storing data packets;

examining means for examining data packets transmitted between a wireless device and a network device to determine whether data packets are directed to transmitting administrative renaming queries to devices connected to the network; and

filter means for filtering our data transmissions between the wireless device and the network device upon a condition, where administrative renaming procedures are prevented from being transmitted to a wireless device.

13. (Previously Amended) A communication interface according to claim 12, wherein the examining means is configured to identify a data packet configured according to a first protocol that is transmitted by the wireless device, and wherein the filter means is configured to subsequently relay data packets that are sent by a network device and that are configured according to the first protocol to the particular wireless device in response to the examining means transmitting a data packet sent by the wireless device, wherein the examining means prevents data packets related to network renaming procedures to the wireless device.

14. (Previously Amended) A communication interface according to claim 12, wherein the examining means is configured to identify a data packet sent by a wireless device that is configured according to a first protocol, and wherein the filter means is configured to subsequently relay data packets to the wireless device that are sent by a network device and that are configured according to the first protocol, wherein the examining means prevents data packets related to network renaming procedures to the wireless device according to the first protocol.

15. (Previously Amended) A communication interface according to claim 12, wherein the examining means is configured to identify a data packet transmitted by a wireless device that indicates that the transmitting wireless device is configured according to a first protocol, and wherein the filter means is configured to subsequently relay data packets that are sent by a network device that are configured according to the first protocol only to wireless devices that have transmitted such a packet having such indicia, wherein the indicia alerts the examining means to prevent data packets related to network renaming procedures to the wireless device.

16. (Previously Amended) A system for communicating between a wireless device and a network device comprising:

an electronic wireless device configured to communicate with other electronic devices according to a communication protocol;

an electronic network device configured to communicate with other electronic devices via a computer network;

a communication interface having a receiver configured to receive data packets, the receiver including a signal receiver configured to receive a signal over a transmission medium and a converter configured to convert the data signal into a form that can be stored; a transmitter configured to transmit data packets over a medium; a storage device configured to store data, the storage device including a storage mechanism for storing data packets received by the receiver; an analyzer configured to examine data packets transmitted between the wireless device and the network device to determine whether the data packets relate to unnecessary administrative procedures related to the operation of the network; and a filter mechanism configured manage data transmissions between the wireless device and the network device and to prevent data packets related to network renaming procedures from being sent to the wireless device.

17. (Currently Amended) A communication interface according to claim 16, wherein the analyzer includes an identifier that is configured to identify a data packet sent by a particular wireless device that is configured according to a first protocol, and wherein the filter mechanism is configured to subsequently relay data packets that are sent by a network device that are configured according to the first protocol that causes data packets related to network renaming procedures to be prevented from being sent ~~to the wireless device~~ to the particular wireless device in response to the analyzer receiving a data packet sent by the particular wireless device.

18. (Previously Amended) A communication interface according to claim 16, wherein the analyzer is configured to identify a data packet sent by a wireless device that is configured according to a first protocol, and wherein the filter mechanism is configured to subsequently relay data packets to the wireless device that are sent by a network device and that are configured according to the first protocol that prevents data packets related to network renaming procedures from being sent to the wireless device.

19. (Previously Amended) A communication interface according to claim 16, wherein the analyzer includes an identifier that is configured to identify a data packet transmitted by a wireless device that indicates that the transmitting wireless device is configured according to a first protocol, and wherein the filter mechanism is configured to subsequently relay data packets that are sent by a network device that are configured according to the first protocol only to

Attorney Docket No. CLAR-00200

wireless devices that have transmitted such a packet having such indicia to prevent data packets related to network renaming procedures from being sent to the wireless device.
